

**Serum C8 By Alpha-Fetoprotein Tumor Marker (Serum) Levels
In Participants 1-2 Years Of Age**
C8 (ng-mL)

AFP Tumor Marker (Serum)	Gender	N	Mean
NORMAL	Female	50	61.1160
	Male	61	101.2623
	Total	111	83.1784
Total	Female	50	61.1160
	Male	61	101.2623
	Total	111	83.1784

**Serum C8 By Alpha-Fetoprotein Marker (Serum) Levels
In Participants 1-2 Years Of Age**

Normal < 87, High \geq 87 (ng/mL)

The WVU website is a communication vehicle to depict associations or their absence for public use. These tables and graphs show many comparisons between lab tests and corresponding population serum PFOA (C8) levels. When it appears that there is a clear relationship between serum C8 and a clinical laboratory value, the meaning of that relationship still requires thought and discussion. Some of the relationships, while real, are weak and not likely to be important. Several are strong, interesting and potentially important, and none of them can be taken to show an etiologic (cause and effect) relationship or its absence without more work. When it comes to causes, scientists interpret these preliminary data with deference to additional work that needs to be done.

These data concerning associations are for public use. They will receive additional collaborative work in peer review format. We hope they prompt public curiosity and suggestions of interested scientists.
