

**Serum C8 By Alpha-Fetoprotein Tumor Marker (Serum) Levels
In Participants ≥ 3 Years Of Age**
C8 (ng-mL)

AFP Tumor Marker (Serum)	Gender	N	Mean
NORMAL	Female	33769	69.4051
	Male	31894	98.2136
	Total	65663	83.3980
HIGH	Female	534	26.6272
	Male	25	119.2480
	Total	559	30.7694
Total	Female	34303	68.7391
	Male	31919	98.2300
	Total	66222	82.9537

The WVU website is a communication vehicle to depict associations or their absence for public use. These tables and graphs show many comparisons between lab tests and corresponding population serum PFOA (C8) levels. When it appears that there is a clear relationship between serum C8 and a clinical laboratory value, the meaning of that relationship still requires thought and discussion. Some of the relationships, while real, are weak and not likely to be important. Several are strong, interesting and potentially important, and none of them can be taken to show an etiologic (cause and effect) relationship or its absence without more work. When it comes to causes, scientists interpret these preliminary data with deference to additional work that needs to be done.

These data concerning associations are for public use. They will receive additional collaborative work in peer review format. We hope they prompt public curiosity and suggestions of interested scientists.
