

Serum C8 By Testosterone (Serum) Levels In Participants ≥ 8 And < 11 Years Of Age C8 (ng-mL)

Testosterone (Serum)	Gender	N	Mean
NORMAL	Female	881	74.1244
	Male	919	83.4308
	Total	1800	78.8758
HIGH	Female	110	49.3773
	Male	153	59.5085
	Total	263	55.2711
Total	Female	991	71.3775
	Male	1072	80.0165
	Total	2063	75.8666

Serum C8 By Testosterone (Serum) Levels In Participants ≥ 8 And < 11 Years Of Age

Females: Normal 0-30, High > 30 (Units: ng/dL)
Males: Normal 0-25, High > 25 (Units: ng/dL)

The WVU website is a communication vehicle to depict associations or their absence for public use. These tables and graphs show many comparisons between lab tests and corresponding population serum PFOA (C8) levels. When it appears that there is a clear relationship between serum C8 and a clinical laboratory value, the meaning of that relationship still requires thought and discussion. Some of the relationships, while real, are weak and not likely to be important. Several are strong, interesting and potentially important, and none of them can be taken to show an etiologic (cause and effect) relationship or its absence without more work. When it comes to causes, scientists interpret these preliminary data with deference to additional work that needs to be done.

These data concerning associations are for public use. They will receive additional collaborative work in peer review format. We hope they prompt public curiosity and suggestions of interested scientists.
